

IN THE CLAIMS:

Please amend the claims as shown below. The claims, as pending in the subject application, read as follows:

1. to 11. (Canceled)

12. (Currently Amended) A ~~An~~ access system for accessing an address, comprising:

~~an operation device for outputting that outputs~~ a control command input by a user to mechanically control ~~[[of]]~~ an image pickup direction of an image pickup device for the image pickup device to obtain an image;

~~a receiving device for receiving that receives~~ an image ~~picked-up~~ obtained by the image pickup device which is controlled based on the control command of the direction of the image pickup device; ~~and~~

a monitoring device that determines whether the image received by said receiving device includes a predetermined image;

~~a control~~ an extracting device for extracting that extracts an address corresponding to ~~[[a]]~~ the predetermined image when the monitoring device determines that the predetermined image is included in the image received by said receiving device;

~~a monitoring device for monitoring whether the image received by said receiving device includes a predetermined image; and~~

~~an accessing device for accessing that accesses~~ the address extracted by the ~~control~~ extracting device corresponding to the predetermined image if when the monitoring device ~~monitors~~ determines that the received image includes the predetermined image and

if a user performs an operation to designate the predetermined image.

13 (Canceled)

14. (Currently Amended) The An-access system according to Claim 12,
wherein the address includes a URL.

15. (Currently Amended) The An-access system according to Claim 12,
wherein the address includes an email address.

16. to 26. (Canceled)

27. (Currently Amended) A computer-executed method for accessing an
address, comprising the steps of:

outputting, by a control device, a control command input by a user to
mechanically control [[of]] an image pickup direction of an image pickup device for the
image pickup device to obtain an image;

receiving, by an information processing apparatus from the image pickup
device, an image picked-up obtained by the image pickup device which is controlled based
on the control command of the direction of the image pickup device;

monitoring determining, by the information processing apparatus, whether
the image received by the receiving step includes a predetermined image;

extracting, by the information processing apparatus, an address
corresponding to the predetermined image when the determining step determines that the

predetermined image is included in the image received in said receiving step; and
accessing, by the information processing apparatus, the address extracted by
the extracting step corresponding to the predetermined image when ~~[[if]]~~ the monitoring
determining step monitors determines that the received image includes the predetermined
image and if a user performs an operation to designate the predetermined image.

28. (Canceled)

29. (Currently Amended) The ~~An~~ access method according to Claim 27,
wherein the address includes a URL.

30. (Currently Amended) The ~~An~~ access method according to Claim 27,
wherein the address includes an email address.

31. to 41. (Canceled)

42. (Currently Amended) A computer-readable storage medium on which
is stored a computer-executable program for a computer to execute ~~executing~~ a method of
~~an access system~~ for accessing an address, wherein the program comprises:

program code of an outputting step of outputting, by an operation device, a
control command input by a user to mechanically control an image pickup ~~of a direction of~~
an image pickup device for the image pickup device to obtain an image;

program code of a reception step of receiving, by an information processing
apparatus, an image ~~picked up~~ obtained by the image pickup device which is controlled

based on the control command of the direction of the image pickup device;

program code of a monitoring determining step of monitoring determining, by the information processing apparatus, whether the image received by the reception step includes a predetermined image;

program code of an extracting step of extracting, by the information processing apparatus, an address corresponding to the predetermined image when the determining step determines that the predetermined image is included in the image received by the reception step; and

program code of an access step of accessing, by the information processing apparatus, the address extracted in the extracting step corresponding to the predetermined image if when the monitoring determining step monitors determines that the received image includes the predetermined image and if a user performs an operation to designate the predetermined image.

43. (Canceled)

44. (Previously Presented) A computer-readable storage medium according to Claim 42, wherein the address includes a URL.

45. (Previously Presented) A computer-readable storage medium according to Claim 42, wherein the address includes an email address.
